ELECTRIC CHARGES AND FIELDS (CHAPTER-1)

CHARGE: - It is the property of the body by nirthe of which it shows both Mutric and magnetic behaviour.

REPRESENTATION - Q or a

- · Charge is a rular quantity
- · SI unit coulomb (C)
- · CGS unit St C (eleutestatic unit of charge) 1C= 3×109 et C ab C (electromagnetic unit of charge) 1 C = 1 ab C

SPECIFIC PROPERTIES OF CHARGE:

- (1) According to Benjamin Franklin, charges are of two types, positive and negative.
- D Like changes suepel and unlike changes attract (fundamental law of electrostatics)
- 3 Charge is always associated with mass. i.e change cannot exist without mass where as mass can exist without charge.
- (9) when a body is positively charged lese electrons mass decreases when a body is negatively charged - gains electrons - mass increases
- (5) Charge is conserved :- The charge of an isolated system remains constant That means, change can neither be created non be destroyed
- 6 charge is quantised: Total charge of a body is equal to the integral multiple of fundamental charge 'e'

ie Q= ± ne, n= an integer (1, 2, 3, ...) * Minimum possible charge = ± e = ± 1.6 × 10-19 C

- Denauge is innaviant: Change is independent of frame of reference. I hat is, change on a body doesnot change unaterur may be its speed.
- 8 <u>Change is additive</u>: Total change of an isolated system is equal to the algebraic sum of changes on individual bodies of the system ie If a system contain these charges, α_1 , α_2 & α_3 then total charge on the system $Q = \alpha_1 + \alpha_2 + \alpha_3$.

CHARGE.

MASS

- 1 Charge cannot enut without
- D Foure between the changes can either be attractive er repulsive.
- 3 Charge deemet depend on the speed of the body.
- (9) Charge can be either pritine, negative en xuro

Mass can exist without charge.

Granitational force between two mass is always attractine

Mass of a bedy changes awarding to the formula, $m = m_0$ where,

C= speed of light in vaccum, m= mass of a bedy moning with velecity v mo= rest mass ef the bedy.

Mass is a pesitive anantity.

ELECTION OF CEAS

METHODS OF CHARGING

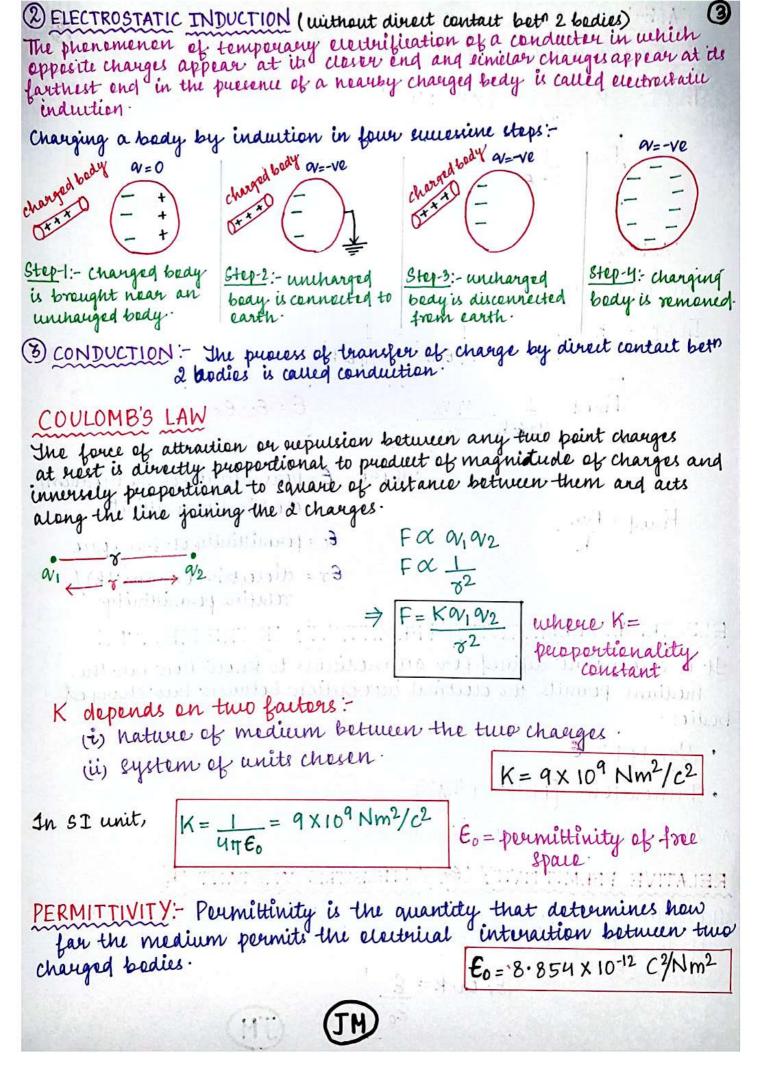

There are three methods of charging:

- 1 Friction (section) | comments
- 2 Electrostatic induction
- 3 conduction
- 1 FRICTION: If we sub one body with another body, then transfer of electrons take place from one body to another body.

The transfer of e-take place from lower work function body to the higher work function body.

Positive	N'egative
Glass seod	Silk dath
waven eath	Plastic objects, rubber shoes, amber
Cat skin	Ebanite rod
Dry hair	comb

· clouds become changed by friction.

CASE-1 my my med

In air/vacum/fue space:

In SI:-
$$K = \frac{1}{4\pi + 6} = 9 \times 10^9 \, \text{Nm}^2/c^2$$

CASE-2

In any medium/dielectric medium

In ST:-
$$K = \frac{1}{4\pi\epsilon_0 \epsilon_8} = \frac{1}{4\pi\epsilon_0 \epsilon_8}$$

Fined =
$$\frac{1}{4\pi \epsilon_0 k} \frac{\alpha_1 \alpha_2}{\sigma^2}$$

Fried = Frac

where, E= permittivity of the medium/ electrical permittivity

€0 = permittivity of free space

€r = dielectric constant (k)/ relative permittinity.

ELECTRICAL PERMITTIVITY / PERMITTIVITY OF THE MEDIUM:

It is a constant defined for all mediums to know how far the medium permits the electrical interaction between two charged bodies.

- · Symbol:- €
- · Dimension: [M-11-3T4A2]
- * Also called as absolute permittivity

RELATIVE PERMITTIVITY (6) / DIELECTRIC CONSTANT (k)

The ratio of the permittinity of the medium to the permittinity of the free space is called relative permittinity (Ex) or diesettic constant (k):

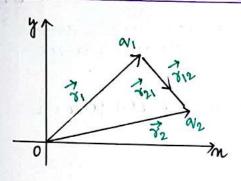

$$\varepsilon_r$$
 or $k = \frac{\varepsilon}{\varepsilon_0}$

· Relatine permittinity or dielectric constant has no unit and dimensionless

- · Symbol: Er or k
- · for vauum, k=1
- · for metal, k=00
- · For water, k=80

COULOMB'S LAW IN VECTOR FORM:

force on a, due to az.

$$\vec{F}_{12} = \frac{K \alpha_{1} \alpha_{2}}{9 \alpha_{21}^{2}} \quad 9\hat{\alpha}_{21}$$

$$= \frac{K \alpha_{1} \alpha_{2}}{\gamma_{21}^{2}} \quad \frac{\vec{\sigma}_{21}}{\sigma_{21}} = \frac{K \alpha_{1} \alpha_{2}}{\gamma_{21}^{3}} \quad \vec{\sigma}_{21}$$

$$= \frac{K \alpha_{1} \alpha_{2}}{|\vec{\sigma}_{1} - \vec{\sigma}_{2}|^{3}} (\vec{\tau}_{1} - \vec{\sigma}_{2})$$

Force on or due to a,

$$\overrightarrow{F}_{21} = \frac{\kappa \alpha_1 \alpha_2}{\sigma_{12}^2} \widehat{\sigma}_{12}$$

$$= \frac{K \alpha_1 \alpha_2}{\gamma_{12}^2} \quad \xrightarrow{\sigma_{12}} \quad = \quad \frac{K \alpha_1 \alpha_2}{\sigma_{12}^3} \quad \xrightarrow{\sigma_{12}}$$

$$=\frac{\mathsf{K} \, \mathsf{W}_1 \, \mathsf{W}_2}{|\vec{\tau}_2 - \vec{\tau}_1|^3} (\vec{\tau}_2 - \vec{\tau}_1) = -\frac{\mathsf{K} \, \mathsf{W}_1 \, \mathsf{W}_2}{|\vec{\tau}_1 - \vec{\tau}_2|^3} (\vec{\tau}_1 - \vec{\tau}_2)$$

F₂₁ = -F₁₂ This means that, the two changes enert equal & epposite ferre on each other so, they about Newton's third can of mation.

CHARACTERSTICS OF COULOMB'S FORCE :-

- 1 Applicable on nalid only for point charges which are at nest:
- 2 obeys innerse equare law (FXL)
- 3 It is a long stange force
- (4) Coulomb's force is inactine when the separation between two charges is less than one formi (10-15 m)
- 5 It is a central force ie it act along the line joining the centres of the two bodies

6 coulomb four depends on the medium within which charges are placed.

15 - 1 13660 714

- Descent force is not affected by the presence of other charged bedies near it
- 18 It obeys newton's third law of motion

FORCE BETWEEN MULTIPLE CHARGES : THE SUPERPOSITION PRINCIPLE :-

when a number of charges are interacting among each other, then the force acting on one charge will be the nector sum of all the forces acting an it due to all other charges.

Then, according to the principle of experposition, the total ferce on change or, is given by

$$F_{12} = \frac{1}{4\pi\epsilon_0} \frac{\alpha_1 \alpha_2}{\sigma_{21}^2} \hat{\tau}_{21}$$

Similarly, the force on charge of due to other charges is given by

$$F_{13} = \frac{1}{4\pi E_0} \frac{v_1 v_3}{v_{31^2}} v_{31}^2$$

Substituting, these values in ear 1 we get,

$$F_{1} = \frac{1}{4\pi \epsilon_{0}} \left[\frac{\alpha_{1}\alpha_{2}}{\gamma_{21}^{2}} \hat{\sigma_{21}}^{2} + \frac{\alpha_{1}\alpha_{3}}{\gamma_{31}^{2}} \hat{\sigma_{31}}^{2} + \dots + \frac{\alpha_{1}\alpha_{n}}{\gamma_{n1}^{2}} \hat{\sigma_{n1}}^{2} \right]$$

$$F_{1i} = \frac{v_1}{4\pi \epsilon_0} \sum_{i=2}^{n} \frac{v_i}{v_{i1}^2} \hat{v}_{i1}$$

ELECTRIC FIELD:

The segion surrounding to a charged body within which another charge emperiences a force is called electric field.

TEST CHARGE

→ The change which produces the electric field is called course change and the change which emperiences the effect of source change is called A continue to the repenjection of test charge.

- unit positive charge is taken as test charge.

- its magnitude is very small in comparison to source charge because its own field chemianet affect the field of source charge.

FLECTRIC FIELD INTENSITY

It is defined as the force emperienced per unit positive text charge placed at that point, without disturbing the enurie charge.

$$\vec{E} = \frac{\vec{F}}{N_0}$$

It is empressed as,
$$\vec{E} = \vec{F}$$
, where $\vec{E} =$ electric field intensity

No = test charge

F = force emperienced by the test charge avo.

· It is a verter evantity

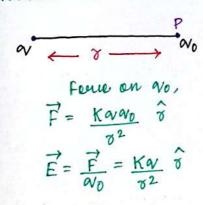

· SI unit: N/C or V/m

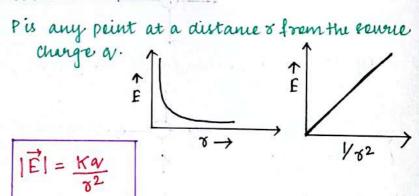

· CGS writ: - D/st C or D/abc

Dimension: MILIT-2 = [MILIT-3A-1]

* Flectoic field due to pesitive charge is always away from it while due to negative charge is always towards it

ELECTRIC FIELD INTENSITY DUE TO POINT CHARGE:

ELECTRIC FIELD DUE TO MULTIPLE CHARGES:

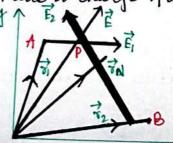

Consider a, az, an changes one placed at a dist of, oz, ... on from origin in vacuum. Hence, the electric field at point P due to charge a, is

$$\overrightarrow{E}_{1} = \frac{\overrightarrow{F}_{1}}{\cancel{a}_{0}} = \frac{1}{4\pi\cancel{e}_{0}} \frac{\cancel{a}_{1}}{\cancel{a}_{1}^{2}\cancel{p}} \quad \widehat{\cancel{a}_{1}\cancel{p}}$$

Similarly,

$$\overrightarrow{E}_2 = \frac{\overrightarrow{F}_2}{v_0} = \frac{1}{4\pi \epsilon_0} \frac{a_2}{v_2^2 P} \xrightarrow{v_2 P}$$

3

Avarding to the superposition principle,

$$\vec{E} = \vec{E}_1 + \vec{E}_2 + \dots + \vec{E}_N$$

$$= \frac{1}{u_{\Pi} \epsilon_0} \left[\frac{\alpha_1}{\delta_{1P}^2} \hat{\delta}_{1P} + \frac{\alpha_2}{\delta_{2P}^2} \hat{\delta}_{2P}^2 + \dots + \frac{\alpha_N}{\delta_{2NP}^2} \hat{\delta}_{NP} \right]$$

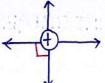

$$\Rightarrow \vec{E} = \frac{1}{u_{\Pi} \epsilon_0} \sum_{i=1}^{N} \frac{\alpha_i}{\delta_{1P}^2} \hat{\delta}_{iP}$$

ELECTRIC FIELD LINES /LINES OF FORCE:

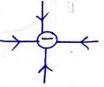

A curne along which the test change would tend to move when bour to do so in an electric field due to a course change These imaginary lines are called electric field lines.

PROPERTIES :-

- 1 They start from positive charge and end at negative charge.
- 2) They energe normally brom the surface of a paidine change.

3) They terminate normally en the surface of a negative charge.

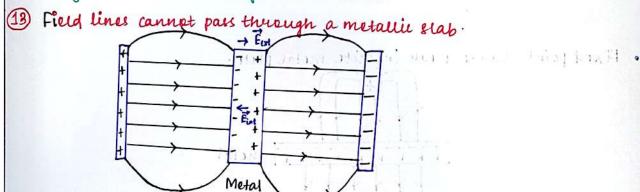

- (9) The field lines have a tendency to empand laterally 80 as to emert a lateral pressure. This emplains repulsion between two like charges.
- 1 Jangent to any point on electric field lines shows the direction of electric field at that point
- 6 Electric field lines contract lengthwise to represent attraction between two unlike charges.

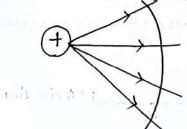

- D'Invo field lines can never intersect each other because if they intersect, then two tangents drawn at that point will nepresent two directions of field at that point, which is not possible
- 1 They are continous smooth curve without any breaks
- 9 They donot form closed loops.
- 10 The negion where lines of force are oroused, its intensity is more
- (1) The number ON of lines per unit cross sectional area perpendicular to the field lines is directly proportional to the magnitude of the intenety of electric field in that region

DN RE

(12) They do not pass thorough a conductor

19 The relative closeness of the field lines gives the strength of electric field

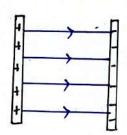

- · Fields close to each other indicate strong field.
- · fields lines away to each other indicate weak field.

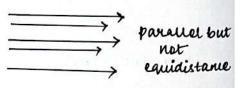

REPRESENTATION OF ELECTRIC FIELD:

Electric fierd lines due to apposite charges are equal in magnitude

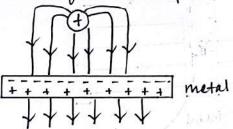

In case of uniform field, the field lines are parallel (to have same direction) and are equidistance (to have same magnitude) to each other

In case of non-uniform field, the field lines are not parallel and are not equiditance to each other.

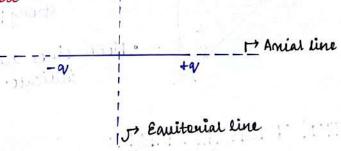

· Fixed point charge near infinite metal plate.

ELECTRIC DIPOLE:

Two equal and appointe changes reparated by a very small distance constitute a dipole.

ELECTRIC DIPOLE MOMENT:

· It determines the strength of electric dipole

• It is define as the product of magnitude of either charge and separation of distance between them P= QX de

|P| = 0 (28)

· vector arrantity

- (13)
- · direction is always from negative change to positive change.
- · Dimension [ATL]
- · SI unit Cm

IDEAL DIPOLE / POINT DIPOLE :-

Suppose, $a \to \infty$, $a \to 0$ such that p is finite. Such a dipose of negligibly small size is called as ideal dipose on point dipose.

POSITION:

C is any point on the arrial line at a distance or from the centre of the dipole

$$\overrightarrow{E}_{1} = \underbrace{\frac{K \cdot v}{B \cdot c^{2}}}_{2} \widehat{c}$$

$$= \underbrace{\frac{K \cdot v}{(\tau - l)^{2}}}_{2} \widehat{c}$$

$$\overrightarrow{F}_2 = \frac{K \cdot Q}{A \cdot L^2} \left(-\hat{L} \right)$$

$$= \frac{K \cdot Q}{(v + L)^2} \left(-\hat{L} \right)$$

$$\overrightarrow{E} = \overrightarrow{E_1} + \overrightarrow{E_2}$$

$$= \underbrace{K \alpha}_{(\overline{v} - I)^2} \widehat{i} + \underbrace{K \alpha}_{(\overline{v} + L)^2} (\overline{v} + L)^2$$

= Kay
$$\left[\frac{(v+l)^2 - (v-l)^2}{(v-l)^2} \right] \hat{2}$$

$$= Kay \left[\frac{4rl}{(8^2-l^2)^2} \right] \hat{z}$$

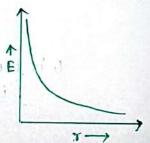

$$= Kq \frac{2v \cdot dl}{(v^2 - l^2)^2} \hat{z}$$

$$\vec{E} = \frac{2Kpn}{(b^2 - l^2)^2}$$

for ideal dipole, l<<<< 8, 8012 can be neglected

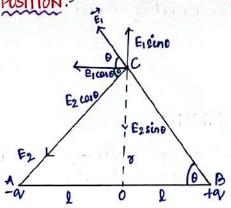

$$\overrightarrow{E} = \underbrace{\frac{2 \, \text{KPV}}{\text{N}^{4}}} \widehat{1}$$

$$\overrightarrow{E} = \underbrace{\frac{2 \, \text{KP}}{\text{V}^{3}}} \widehat{2}$$

OR BROAD SIDE ON POSITION:

C is any point on the equitorial line at a distance of from the centre of the dipole

$$E_{1} = \frac{K\alpha}{BC^{2}}$$

$$= \frac{K\alpha}{8^{2}+L^{2}}$$

Due to -a charge,

$$E_2 = \frac{KQ}{AC^2}$$
$$= \frac{KQ}{8^2 + L^2}$$

E1 sino and E2 sino carrel each other

Resultant Intensity, $\vec{E} = (\vec{E}_1 \cos 0 + .E_2 \cos 0)(-\hat{i})$

=
$$2 \text{ KeV} (-\hat{z})$$

= $2 \text{ KeV} \underline{l} (-\hat{z})$

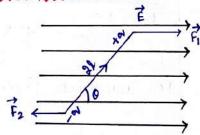

$$= \frac{2 \text{KeV} l}{(8^2 + l^2)^{3/2}} + \hat{l}$$

$$\vec{E} = \frac{KP}{(\tau^2 + \iota^2)^{3/2}} (-\hat{\imath})$$

for ideal dipole, l <<< , l' can be negletted

$$\vec{E} = \frac{KP}{\gamma^3} (\hat{z})$$

DIPOLE IN UNIFORM ELECTRIC FIELD:

0 is the angle between dipole moment and intensity.

force on ta.

FI = QE

force on-a,

F2=-QE

 $\vec{F} = \vec{F_1} + \vec{F_2} = 0$

So no translatery motion

As two fours are not in same line of action, so they contitude a couple due to which dipole votate. 7=(21) fino = alayEsino

It is a condition of stable equilibrium.

Case-2 when 0=180°

T=0

It is a condition of unitable equilibrium Care-3

when 0=90

C=PE

Maximum torque

NEUTRAL POINT :-

It is appoint in an electric field where when any change is placed emperience no force.

CASE-1

- for 2 like changes, neutral point lies between them?
- when similar change is placed at neutral paint, it is in unstable equilibrium along y-anis and stable equilibrium along x-anis
- · when dissimilar charge is placed at neutral point, it is in stable equilibrium along Y-axu and unstable equilibrium along X-axis.

CASE-2

- · for two unlike charges, neutral point lies at the side of Cers magnitude change.
- . If of = 92, then neutral point is not persible.

ANT WORLD FOR

PHYSICAL SIGNIFICANCE:

It determines the amount of electric field lines linked with the swefare.

DEFINATION:

- It is defined as the dot product of electric field intensity with the avial vector of a evulace:
- · Electric flum at any point can be defined as the number of field line passing normally through that area placed incide an electric field.
- · SI unit Nm2/6 or Vm
- · Scalar quantity
- · Dimension [ML3T-3A-1]

$$\phi = \vec{E} \cdot \vec{S}$$

$$\Rightarrow \phi = S\vec{E} \cdot \vec{A}\vec{S}$$

Case-1 (for surface S1)

0 = <90°, cos0 = tre, flux=tre when the lines of four leane the englace, the flux is position $\frac{\text{Care-2}}{0=90^{\circ}, \cos 0=0}$ $\frac{\cos 0}{\cos 0}$

So, when lines of Some enter to the swefare, flux is

negative

Case-3 (for 53)

GAUSS LAW:

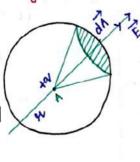

PROOF:

Jake a charge to at point

A. Jake a gaussian

envelope in the shapeola

evulace in the shape of a sphere of radius ocentred at tax

 $= \frac{k\alpha}{r^2} \times 4\pi r^2$ $= k\alpha 4\pi$ $= \frac{1}{4\pi \epsilon_0} \approx 4\pi$ $= \frac{2}{\epsilon_0}$

DERIVATION OF COULDMB'S LAW FROM GAUGE LAW:

(1)

and a little country of the late of

According to games law,

$$\Rightarrow \oint Eds \cos 0 = \frac{Ven}{60}$$

$$\Rightarrow E = \frac{Q}{u_{11}r^{2}E_{0}} \Rightarrow E = \frac{KQ}{\sqrt{2}}$$

Suppose, a charge is placed on the periphery of the faunian eurface then force exerted on it will be,

IMPORTANT POINTS ON GAUSS LAW:-

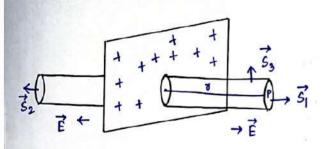

- · Gauss Law is applicable for any cloud surface, whatever its shape and sixe
- . The englace in which gams law is applied is carred gamian englace.
- · Fluor linked with closed surface is independent of area of the surface.
- If the medium is di-electric, then φ = wen Eak

CONTINOUS CHARGE DISTREBATION:

(a) Linear charge distrubation:

17

INFINITE THIN PLANE SHEET :-

6 = swelface change density

P is any point at a distance of from the plane sheet.

using gaves law,

$$\frac{60}{5}$$
Feds cas $0 + \int Eds \cos 90^{\circ} = \frac{40}{60}$

$$\Rightarrow$$
 Es + Es = $\frac{\text{even}}{\text{Eo}}$

$$\Rightarrow e = \frac{6}{260}$$

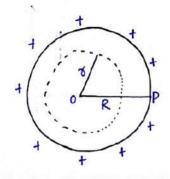

In vector form,

$$\vec{E} = \frac{6}{260} \hat{n}$$

APPLICATION-3

Electric field is independent

SPHERICAL SHELL (SOLID CONDUCTING SPHERE)

Case-1 Inside

Pis any point at a distance of from the centre

using gauss law,

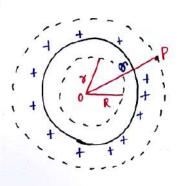

E=0

Care-11 (87R)

<u>Outside</u> Applying gausslaw,

$$\Rightarrow g\vec{E} \cdot \vec{ols} = \frac{\alpha}{\epsilon_0}$$

$$\Rightarrow \text{EUTT8}^2 = \frac{a'}{60}$$

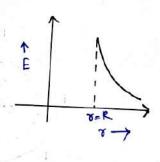

This empression is same as the empression used in intercity due to point change of the ephersial shell behave as if they are concentrated at the centre.

Care-111

on the surface (r=R)
